

1. Find a regular expression that represents the complement of the language represented by the following DFA:

The DFA is already completely specified, so the DFA of the complement is:

Determine a corresponding regular expression!

The regular expression is:
 $(1|01^*0)^*01^*$

2. Write a CFG without epsilon transitions that generates the language $\{ a^{n+m+1} b^n c^m \mid n \geq 0, m \geq 0 \}$

$$a^{n+m+1} b^n c^m = a \underbrace{a^m a^n b^n c^m}_{\substack{A \\ B \\ S}}$$

$$S \rightarrow aB$$

$$B \rightarrow aBc \mid A$$

$$A \rightarrow aAb \mid \epsilon$$

Eliminate the epsilon-production:

$$S \rightarrow aB \mid a$$

$$B \rightarrow aBc \mid A \mid ac$$

$$A \rightarrow aAb \mid ab$$

3. Given the following grammar, find NULLABLE(X) and FIRST(X) for each nonterminal X of the grammar, and then find the first row of the LR(1) parsing table for it.

- 1,2 $S \rightarrow (L) \mid AB$
 3,4 $L \rightarrow L, S \mid S$
 5,6 $A \rightarrow Aa \mid \epsilon$
 7,8 $B \rightarrow Bb \mid b$
 9 $S' \rightarrow S$

	NULLABLE	FIRST
S'	F	(a b
S	F	(a b
L	F	(a b
A	T	a
B	F	b

LR(1) automaton:

$S' \rightarrow \cdot S, \$$	$S \rightarrow$	[]
$S \rightarrow \cdot (L), \$$	$C \rightarrow$	[]
$S \rightarrow \cdot AB, \$$	$A \rightarrow$	[]
$A \rightarrow \cdot Aa, b/a$		
$A \rightarrow \cdot , b/a$		

Parsing table:

	a	b	()	,	\$	S'	S	L	A	B
ϵ	rg	rg	sq					1		3	

4. Transform the following SDT so that it can be implemented by a bottom-up parser and then indicate which string it will print when the input is aadbcc.

$S \rightarrow a S \{ \text{print "x"} \} B$

$S \rightarrow d \{ \text{print "y"} \}$

$B \rightarrow b \{ \text{print "z"} \} B$

$B \rightarrow C$

$C \rightarrow c \{ \text{print "w"} \}$

$S \rightarrow a S M B$

$M \rightarrow \epsilon \{ \text{print "x"} \}$

$S \rightarrow d \{ \text{print "y"} \}$

$B \rightarrow b N B$

$B \rightarrow C$

$N \rightarrow \epsilon \{ \text{print "z"} \}$

$C \rightarrow c \{ \text{print "w"} \}$

$\Rightarrow yxzzwxw$
